

Supplementary Fig. 2. Performance at Balloon Analogue Risk Task (BART) on first balloon and last balloon series for type 1 diabetes mellitus (T1DM) and healthy participants, comparing two moments of experimental task: prior and after iterative decision making. T1DM group mean performance on first balloon was not significantly different from last balloon (unchangeable performance). Healthy participants do learn after iterative decision making ($P < 0.05$) and do become better than T1DM participants ($P < 0.05$). CI, confidence interval.
